

Raspberry Pi Real-Time Transit Display

This project is used to track specific CTA bus and train routes but can be modified for other transit groups. For this project the following are required:

- Raspberry Pi 3 or newer (I used a Pi [4B](#))
- 7-inch display (A 5-inch display would also work) "[7-inch](#)"
- An sd card and computer to flash the firmware.
- Access to a 3D printer for the enclosure or use the provided stand.

Following the Raspberry Pi instructions download any of the standard operating systems for your device. Create a URL for the ideal transit display from [here](#). Then using the file Kioskscreen create and add the URL before rebooting the device.

The 3d printed enclosure is meant to provide a durable case and a comfortable viewing angle from a desk or table. It can be printed with PLA and on any side with minimal supports.
